# Motivation: Tree-Rooted Graphs

A tree-rooted graph is a triple  $(G, T, \gamma)$  where G is a connected graph, T is a spanning tree of G, and  $\gamma = uv$  is a distinct, oriented edge with  $uv \in e(G) \setminus e(T)$ . We view T as a rooted tree with root u.

▲□▶▲□▶▲□▶▲□▶ ▲□ ▶ ▲□

Superimposing a Fixed Graph and a Random Graph

Jordan Barrett

### Motivation: Tree-Rooted Graphs

A tree-rooted graph is a triple  $(G, T, \gamma)$  where G is a connected graph, T is a spanning tree of G, and  $\gamma = uv$  is a distinct, oriented edge with  $uv \in e(G) \setminus e(T)$ . We view T as a rooted tree with root u.

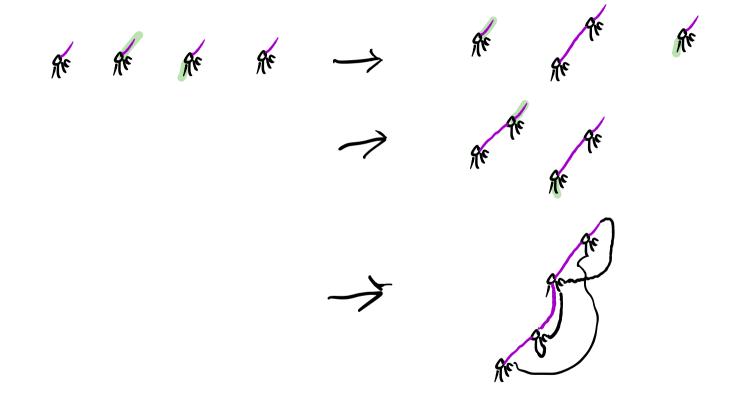

#### Theorem

For each  $n \ge 1$ , let  $d^n = (d^n(v)1 \le v \le n)$  be a degree sequence, and let  $(G_n, T_n, \Gamma_n)$  be chosen uniformly at random among all simple tree-rooted graphs with vertex set [n] and degree sequence  $d^n$ . Then (under certain conditions on the limiting distribution of  $d^n$ ) there exists a constant  $\sigma$  (dependent on the limiting distribution) such that

$$\frac{\sigma}{n^{1/2}} T_n \stackrel{\text{dist}}{\to} \mathcal{T}$$

as  $n \to \infty$  with respect to the Gromov-Hausdorff-Prokhorov topology, where T is the Brownian continuum random tree.

# Motivation: Problem/Solution

Problem: The configuration model does not necessarily give a simple graph.

Solution: Prove that, under this construction, the probability that the graph is simple asymptotically approaches a constant greater that zero.

・ロト < 団ト < 国ト < 国ト < 国 ・ のへ(?)</li>

Fix a sequence of simple graphs  $(H_n, n \ge 1)$  with  $v(H_n) = [n]$  for all  $n \ge 1$ .

Superimposing a Fixed Graph and a Random Graph

Jordan Barrett

Fix a sequence of simple graphs  $(H_n, n \ge 1)$  with  $v(H_n) = [n]$  for all  $n \ge 1$ .

For each  $n \ge 1$  let  $d^n = (d^n(v), 1 \le v \le n)$  be a degree sequence. Let  $G_n = G(d^n)$  be a random graph with degree sequence  $d^n$ , distributed according to the configuration model.

### Deterministic Bounds: Proof

We will denote a generic element of  $\mathcal{N}^s$  by z where  $z = (z_1, \ldots, z_s)$ . We use the following indicator notation:

$$\mathbf{1}_{[z]} = \prod_{i=1}^s \mathbf{1}_{[z_i]}.$$

Superimposing a Fixed Graph and a Random Graph

Jordan Barrett

We will denote a generic element of  $\mathcal{N}^s$  by z where  $z = (z_1, \ldots, z_s)$ . We use the following indicator notation:

$$\mathbf{1}_{[z]} = \prod_{i=1}^s \mathbf{1}_{[z_i]}.$$

We also use the following summation notation:

$$\sum_{\substack{z \in \mathcal{N}^{s} \\ z_{i} \neq z_{j} \text{ for all } i \neq j}}^{\star}$$

< ロ > < 目 > < 目 > < 目 > < 目 > < 回 < つ < つ < つ </li>

Jordan Barrett

We will denote a generic element of  $\mathcal{N}^s$  by z where  $z = (z_1, \ldots, z_s)$ . We use the following indicator notation:

$$\mathbf{1}_{[z]} = \prod_{i=1}^s \mathbf{1}_{[z_i]}.$$

We also use the following summation notation:

$$\sum_{\substack{z \in \mathcal{N}^{s} \\ z_{i} \neq z_{j} \text{ for all } i \neq j}}^{\star}$$

Using this notation, we can say that

$$\mathbf{E}\left((N)_{s}\right) = \sum^{*} \mathbf{P}\left\{\mathbf{1}_{[z]} = 1\right\}.$$
(2)

Jordan Barrett

We say z is *non-conflicting* if all half-edges among all elements in z are distinct, and otherwise we say z is *conflicting*.

・ロト・日・・日・・日・・ 日・

We say z is non-conflicting if all half-edges among all elements in z are distinct, and otherwise we say z is conflicting. If z is non-conflicting then, letting  $m = \frac{1}{2} \sum_{v=1}^{n} d^{n}(v)$ ,

$$\mathbf{P}\left\{\mathbf{1}_{[z]}=1\right\} = \prod_{i=0}^{s-1} \frac{1}{2m-1-2i}.$$
(3)

Superimposing a Fixed Graph and a Random Graph

Jordan Barrett

We say z is non-conflicting if all half-edges among all elements in z are distinct, and otherwise we say z is conflicting. If z is non-conflicting then, letting  $m = \frac{1}{2} \sum_{v=1}^{n} d^{n}(v)$ ,

$$\mathbf{P}\left\{\mathbf{1}_{[z]}=1\right\}=\prod_{i=0}^{s-1}\frac{1}{2m-1-2i}.$$
(3)

Let er(z) be defined as

$$er(z) := \mathbf{P} \left\{ \mathbf{1}_{[z]} = 1 \right\} - \prod_{i=0}^{s-1} \frac{1}{2m - 1 - 2i}.$$

Jordan Barrett

We say z is non-conflicting if all half-edges among all elements in z are distinct, and otherwise we say z is conflicting. If z is non-conflicting then, letting  $m = \frac{1}{2} \sum_{v=1}^{n} d^{n}(v)$ ,

$$\mathbf{P}\left\{\mathbf{1}_{[z]}=1\right\}=\prod_{i=0}^{s-1}\frac{1}{2m-1-2i}.$$
(3)

Let er(z) be defined as

$$er(z) := \mathbf{P} \left\{ \mathbf{1}_{[z]} = 1 \right\} - \prod_{i=0}^{s-1} \frac{1}{2m - 1 - 2i}.$$

Then

$$\mathbf{E}\left((N)_{s}\right) = \frac{(|\mathcal{N}|)_{s}}{\prod_{i=0}^{s-1} 2m - 1 - 2i} + \sum_{z \text{ is conflicting}}^{\star} er(z).$$

▲□▶ ▲□▶ ▲目▶ ▲目▶ 目 うへぐ

Jordan Barrett

We say z is non-conflicting if all half-edges among all elements in z are distinct, and otherwise we say z is conflicting. If z is non-conflicting then, letting  $m = \frac{1}{2} \sum_{v=1}^{n} d^{n}(v)$ ,

$$\mathbf{P}\left\{\mathbf{1}_{[z]}=1\right\} = \prod_{i=0}^{s-1} \frac{1}{2m-1-2i}.$$
(3)

Let er(z) be defined as

$$er(z) := \mathbf{P} \left\{ \mathbf{1}_{[z]} = 1 \right\} - \prod_{i=0}^{s-1} \frac{1}{2m - 1 - 2i}.$$

Then

$$\mathbf{E}\left((N)_{s}\right) = \frac{(|\mathcal{N}|)_{s}}{\prod_{i=0}^{s-1} 2m - 1 - 2i} + \sum_{z \text{ is conflicting}}^{\star} er(z).$$

By the triangle inequality this implies

$$\left| \mathsf{E}\left( (N)_{s} \right) - \frac{(|\mathcal{N}|)_{s}}{\prod_{i=0}^{s-1} 2m - 1 - 2i} \right| \leq \sum_{z \text{ is conflicting}}^{\star} |er(z)|. \tag{4}$$

#### Jordan Barrett

If z is conflicting, then there must be some  $z_a, z_b \in z$  with  $z_a = (ui, vj)$  and  $z_b = (ui, vk)$ , or with  $z_a = (ui, vk)$  and  $z_b = (uj, vk)$ . Here is a visual representation of a conflicting z:

$$2 = (2_1, 2_2, \dots, 2_5)$$

### Tying it Together: Last Step

$$egin{aligned} &rac{(|\mathcal{N}|)_s}{\prod_{i=0}^{s-1}2m-1-2i} = (1+o(1))rac{|\mathcal{N}|^s}{(2m)^s} \ &= (1+o(1))\left(rac{\sum_{uv\in e(H)}d(u)d(v)}{\sum_{u\in [n]}d(u)}
ight) \ &= (1+o(1))\left(rac{\sum_{i,j\geq 1}ijlpha^n(i,j)}{\mu_1(p^n)}
ight) \ &= (1+o(1))\eta^s. \end{aligned}$$

Hence,

 $\mathsf{E}((N)_s) \to \eta^s.$

We require quite a few restrictions:

We require quite a few restrictions:

 $p^n \rightarrow p$  both pointwise and in second moment.

Superimposing a Fixed Graph and a Random Graph

Jordan Barrett

We require quite a few restrictions:

 $p^n \rightarrow p$  both pointwise and in second moment.  $\frac{1}{n} \sum_{uv \in e(H)} d(u)d(v)$  converges.

We require quite a few restrictions:

 $p^n \rightarrow p$  both pointwise and in second moment.  $\frac{1}{n} \sum_{uv \in e(H)} d(u)d(v)$  converges. The max degree in H is o(n).

We require quite a few restrictions:

 $p^n \rightarrow p$  both pointwise and in second moment.  $\frac{1}{n} \sum_{uv \in e(H)} d(u)d(v)$  converges. The max degree in H is o(n).

Can we relax any of these constraints?

Jordan Barrett
