Decomposition problem - partition edges of *G* so that each part has some specified property.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

Introduction

Decomposition problem - partition edges of *G* so that each part has some specified property.

(ロ) (同) (三) (三) (三) (○) (○)

G could be a graph / directed graph / hypergraph

May wish to partition E(G) into e.g.

- cliques (of fixed size)
- (perfect) matchings
- paths (of fixed length)
- (Hamilton) cycles
- trees

G could be a graph / directed graph / hypergraph

May wish to partition E(G) into e.g.

- cliques (of fixed size)
- (perfect) matchings
- paths (of fixed length)
- (Hamilton) cycles
- trees

 $\chi'(G) = \min \#$ matchings needed to decompose E(G)

•
$$\chi'(G) \ge \Delta(G)$$

•
$$\chi'(G) \in \{\Delta(G), \Delta(G) + 1\}$$

Almost all G satisfy χ'(G) = Δ(G)

(Vizing) (Erdős-Wilson).

Upper bound

• $pn(D) \leq |E(D)|$ (equality if D bipartite)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

Upper bound

• $pn(D) \le |E(D)|$ (equality if D bipartite)

Lower bound

• Any path decomposition of D has at least

- $d^+(v) d^-(v)$ paths starting at vertex v
- $d^{-}(v) d^{+}(v)$ paths ending at vertex v

Hence

$$pn(D) \ge \frac{1}{2} \sum_{v \in V(D)} |d^+(v) - d^-(v)|.$$

Conjecture (Alspach, Mason, Pullman, 1976)

pn(T) = ex(T) for every even tournament T.

Theorem (Patel-Lo-Skokan-Talbot (2020) + Girão-Granet-Künh-Lo-Osthus (2021+))

The conjecture holds (asymptotically).

NP-complete to determine if pn(D) = ex(D) (De Vos)

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ のへで

NP-complete to determine if pn(D) = ex(D) (De Vos)

Erdős-Renyi random graph D_{n,p}

- Start with *n* isolated vertices.
- Add each directed edge independently with probability *p*.

(ロ) (同) (三) (三) (三) (○) (○)

NP-complete to determine if pn(D) = ex(D) (De Vos)

Erdős-Renyi random graph D_{n,p}

- Start with *n* isolated vertices.
- Add each directed edge independently with probability *p*.

Theorem (Espuny Díaz, Patel, Stroh (2021+))

Suppose

$$n^{-1/3}\log^4 n \le p \le 1 - n^{-1/5}\log^3 n$$

and let $D \sim D_{n,p}$. Then

$$\mathbb{P}(pn(D) = ex(D)) \rightarrow 1 \quad as \quad n \rightarrow \infty.$$

NP-complete to determine if pn(D) = ex(D) (De Vos)

Erdős-Renyi random graph D_{n,p}

- Start with *n* isolated vertices.
- Add each directed edge independently with probability *p*.

Theorem (Espuny Díaz, Patel, Stroh (2021+))

Suppose

$$n^{-1/3}\log^4 n \le p \le 1 - n^{-1/5}\log^3 n$$

and let $D \sim D_{n,p}$. Then

$$\mathbb{P}(pn(D) = ex(D)) \rightarrow 1 \quad as \quad n \rightarrow \infty.$$

- p = 1/2: almost all *D* satisfy pn(D) = ex(D).
- Some upper bound on *p* necessary.
- Show pn(D) = ex(D) for many "nonrandom-like" D.
