### Why do we need relations?

► For 1 qubit Clifford+T operators

- Exact synthesis algorithm (T-optimal)
- Matsumoto-Amano normal form (T-optimal, unique)

#### THTSHTHTHTSHTSHTHTZ

- ▶ For *n* qubits Clifford+T operators
  - Exact synthesis Giles-Selinger algorithm (but not T-optimal)
  - No normal form so far
  - How to minimize the T-count?

### Clifford+T operators

The class of Clifford+T operators is the smallest class of unitary operators that includes the operators

$$\omega = e^{i\pi/4}, \quad H = \frac{1}{\sqrt{2}} \begin{pmatrix} 1 & 1 \\ 1 & -1 \end{pmatrix}, \quad S = \begin{pmatrix} 1 & 0 \\ 0 & i \end{pmatrix}, \quad T = \begin{pmatrix} 1 & 0 \\ 0 & \omega \end{pmatrix}$$
$$Z_c = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & -1 \end{pmatrix} = \underbrace{-\underline{Z}}_{-\underline{Z}}_{-\underline{Z}} = \underbrace{-\underline{Z}}_{-\underline{Z}}_{-\underline{Z}}_{-\underline{Z}} = \underbrace{-\underline{Z}}_{-\underline{Z}}_{-\underline{Z}},$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

and is closed under composition and tensor product.

### The main theorem

**Theorem.** The following set of relations is complete for 2-qubit Clifford+T circuits:

 $\omega^8 = 1$  $H^2 = 1$  $S^4 = 1$  $SHSHSH = \omega$ =\_<u>5</u>\_\_ -<u>+</u>\_S\_-== <u>—H-S-S-H</u>-|s||s||h|= = -H-SSHH SHH —<u>5</u>—H <u>--[5]-[H]-[5]-</u>  $...,^{-1}$  $\cdot \omega^{-1}$ =  $-\overline{S}$

### Clifford+T operators on 2 qubits

Notations for 2 qubits Clifford+T operators:

$$T_0 = T \otimes I = \underline{-T}, \quad T_1 = I \otimes T = \overline{-T}$$

Similarly for  $H_0, H_1, S_0, S_1$ .

The group of 2 qubit Clifford+T operators is the smallest group containing

$$\omega, Z_c, T_0, T_1, H_0, H_1, S_0, S_1$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Clifford+T and  $U_4(\mathbb{Z}[\frac{1}{\sqrt{2}}, i])$ 

**Theorem** (Giles and Selinger, arXiv:1212.0506). The group of 2 qubits Clifford+T operators is the index 2 subgroup of  $U_4(\mathbb{Z}[\frac{1}{\sqrt{2}}, i])$  consisting of operators with determinant  $\pm 1, \pm i$ .

Here,  $U_4(\mathbb{Z}[\frac{1}{\sqrt{2}}, i])$  is the group of unitary  $4 \times 4$  matrices with entries in  $\mathbb{Z}[\frac{1}{\sqrt{2}}, i]$ .

### Greylyn's result

**Theorem** (Greylyn, arXiv:1408.6204). The group  $U_4(\mathbb{Z}[\frac{1}{\sqrt{2}}, i])$  can be presented by 16 generators

$$X_{[i,j]}, H_{[i,j]}, \omega_{[k]} \quad (1 \leq i < j \leq 4, 1 \leq k \leq 4)$$

and 123 equations.

Here,  $\omega_{[k]}$ , and  $X_{[i,j]}$ ,  $H_{[i,j]}$  are one- and two-level operators, e.g.:

$$\omega_{[4]} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & \omega \end{pmatrix}, \quad X_{[2,3]} = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{pmatrix}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Figure from Greylyn's master thesis arXiv:1408.6204

### Proof idea of Greylyn's theorem

1. Build the *Cayley graph* of the group. Vertices = group elements, edges = generators.

### Proof idea of Greylyn's theorem

1. Build the *Cayley graph* of the group. Vertices = group elements, edges = generators. Cycles = relations.

### Proof idea of Greylyn's theorem

- 1. Build the *Cayley graph* of the group. Vertices = group elements, edges = generators. Cycles = relations.
- 2. The Giles-Selinger algorithm gives a *canonical path* from each group element to the identity. This forms a *spanning tree*.

Proof idea of Greylyn's theorem, continued

3. Find finitely many relations of the form

such that any arbitrary path can be transformed to the equivalent canonical path. By induction on the "height" of a and b.

We have Clifford+ $T \subset U_4(\mathbb{Z}[\frac{1}{\sqrt{2}}, i])$ . Greylyn's result gives us generators and relations for the bigger group.

We face the following problem:

**Problem.** Let H be a subgroup of G, and suppose we have a presentation of G by generators and relations. Can we find a presentation of H by generators and relations?

We have Clifford+ $T \subset U_4(\mathbb{Z}[\frac{1}{\sqrt{2}}, i])$ . Greylyn's result gives us generators and relations for the bigger group.

We face the following problem:

**Problem.** Let H be a subgroup of G, and suppose we have a presentation of G by generators and relations. Can we find a presentation of H by generators and relations?

#### Example.

$$G = \langle A, B, C \mid A^2, B^2, C^2, (BC)^3, (AC)^2, (AB)^4 \rangle$$

Let X = AC, Y = BA.

$$H = \langle X, Y \mid \rangle$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Fortunately, there is a method for computing this.

**Lemma.** If  $(G_0, S)$  is a presentation of group G, and  $H = \langle H_0 \rangle$  is a subgroup of G, and if C, f, and  $\overline{h}$  are chosen as below, then  $(H_0, \mathcal{R})$  is a presentation of H, where  $\mathcal{R}$  consists of the following relations:

(A) For each generator  $x \in H_0$ , a relation  $x = \overline{g}(f_x) \in \mathcal{R}$ ; and

(B) For each coset representative  $c \in C$  and each relation  $s = t \in S$ , a relation  $u = v \in \mathcal{R}$ , where  $(u, d) = \overline{h}(c, s)$ , and  $(v, e) = \overline{h}(c, t)$ .

## C, f, and $\overline{h}$

Coset representative C

- $x \in H_0$  can be written as a finite product  $f_x$  of elements in  $G_0$
- Define a map (where w and d satisfy cy = wd)

$$egin{aligned} h: \mathcal{C} imes \mathcal{G}_0 
ightarrow ec{\mathcal{H}}_0 imes \mathcal{C} \ & (c, y) \mapsto (w, d) \end{aligned}$$

Since  $G = \langle G_0 \rangle$ , extend *h*, where  $h(c_{i-1}, y_i) = (w_i, c_i)$ 

$$\overline{h}: C \times \vec{G}_0 \to \vec{H}_0 \times C$$
$$\overline{h}(c_0, y_1 y_2 \dots y_n) = (w_1 w_2 \dots w_n, c_n)$$

• Define  $\overline{g}: H \to H$  given by  $\overline{g}(u) = v$  iff  $\overline{h}(1, u) = (v, 1)$ 

・ロト ・ 日・ ・ 田・ ・ 日・ うらぐ

Choice of C, f, and h

• 
$$C = \{1, \omega_{[4]}\}$$

• Choice of  $f_x$ 

x	$f_X$	x	$f_{X}$
H <sub>0</sub>	$H_{[1,3]}H_{[0,2]}$	Z <sub>c</sub>	$\omega^{4}_{[3]}$

### Reduction of equations

- Apply this lemma, we get 8 + 246 = 254 equations, all very long.
- ► We already know some "obvious" equations:
  - All Clifford equations
  - Obvious Clifford+T equations

- After automatic reduction, we have 40 left
- After manual reduction, we have 3 left

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

$$\frac{1}{1-1} \frac{1}{1-1} \frac{1}$$

### Sketch of the automated reduction

Following Gosset, Kliuchnikov, Mosca, and Russo (arXiv:1308.4134), we define, for any Pauli operators *P*, *Q*:

$$R(P\otimes Q)=rac{1+\omega}{2}I+rac{1-\omega}{2}(P\otimes Q).$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

### Sketch of the automated reduction

Following Gosset, Kliuchnikov, Mosca, and Russo (arXiv:1308.4134), we define, for any Pauli operators *P*, *Q*:

$$R(P\otimes Q)=rac{1+\omega}{2}\,I+rac{1-\omega}{2}\,(P\otimes Q).$$

Then every Clifford+T operator can be written (not uniquely) as

$$R(P_1 \otimes Q_1) \cdots R(P_k \otimes Q_k) C$$
,

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

where  $P_j$ ,  $Q_j$  are Pauli and C is Clifford.

### Sketch of the automated reduction

Following Gosset, Kliuchnikov, Mosca, and Russo (arXiv:1308.4134), we define, for any Pauli operators *P*, *Q*:

$$R(P\otimes Q)=rac{1+\omega}{2}\,I+rac{1-\omega}{2}\,(P\otimes Q).$$

Then every Clifford+T operator can be written (not uniquely) as

$$R(P_1 \otimes Q_1) \cdots R(P_k \otimes Q_k) C,$$

where  $P_j$ ,  $Q_j$  are Pauli and C is Clifford. We can use the "obvious" equations to convert any Clifford+T operator to this form. Also,  $R(P \otimes Q)$  and  $R(P' \otimes Q')$  commute iff  $P \otimes Q$  and  $P' \otimes Q'$  commute. Using these techniques, most of the 254 equations can be automatically proven.

### This concludes the proof of the main theorem!

**Theorem.** The following set of relations is complete for 2-qubit Clifford+T circuits:

Sac
